

Dynamic Urban Economics

Brian Greaney, Andrii Parkhomenko, and Stijn Van Nieuwerburgh

Discussion by Vincent Rollet

Dynamics and heterogeneity are important

- (Trade) On **average** and in **steady state**, **lowering trade barriers** is beneficial.
 - But some people lose on the transition path.
 - Failing to take this into account can lead to backlash.
 - This is now well studied.

Dynamics and heterogeneity are important

- (Trade) On **average** and in **steady state**, **lowering trade barriers** is beneficial.
 - But some people lose on the transition path.
 - Failing to take this into account can lead to backlash.
 - This is now well studied.
- (Urban) On **average** and in **steady state**, **upzoning** is beneficial.
 - But some people lose on the transition path.
 - Failing to take this into account can lead to backlash (?)
 - This is not well studied.

- (Urban) On **average** and in **steady state**, **upzoning** is beneficial.
 - But some people lose on the transition path.
 - Failing to take this into account can lead to backlash (?)
 - This is not well studied.
- But it is hard to study.
 - Dynamics, migration, commuting, housing frictions, many locations...

This paper

- Amazing paper.
 - Uses state-of-the-art methods to solve a model with key dimensions.
 - Highlights the importance of a rich model.

This paper

- Amazing paper.
 - Uses state-of-the-art methods to solve a model with key dimensions.
 - Highlights the importance of a rich model.
- Opens an agenda.
 - Applications are already in the pipeline: WFH, office-to-residential conversions, etc.

- **This discussion:** Four important urban problems that could be revisited.

Problem 1: Gentrification

- Demand/amenity shocks to some neighborhoods, leading to price increases.
 - Poorer residents have to move out, transition path is painful.
 - Need to understand both dynamics and heterogeneity.

Problem 1: Gentrification

- Demand/amenity shocks to some neighborhoods, leading to price increases.
 - Poorer residents have to move out, transition path is painful.
 - Need to understand both dynamics and heterogeneity.
- Can policy limit the losses?

Problem 1: Gentrification

- Demand/amenity shocks to some neighborhoods, leading to price increases.
 - Poorer residents have to move out, transition path is painful.
 - Need to understand both dynamics and heterogeneity.
- Can policy limit the losses?
- Extension: non-homothetic preferences.

Problem 2: Place-based policy

- E.g., enterprise zones, resident wage taxes.
 - Incidence of these policies is unclear due to commuting.
 - Effects may take time to materialize because of migration and construction.

Problem 2: Place-based policy

- E.g., enterprise zones, resident wage taxes.
 - Incidence of these policies is unclear due to commuting.
 - Effects may take time to materialize because of migration and construction.
- What are the dynamic effects of these policies?

Problem 3: Natural risks

- E.g., higher disaster risk by the sea, FEMA reclassifies an area.
 - City structure will adapt over time, but slowly.

Problem 3: Natural risks

- E.g., higher disaster risk by the sea, FEMA reclassifies an area.
→ City structure will adapt over time, but slowly.
- How are the losses distributed? How can policy help?

Problem 3: Natural risks

- E.g., higher disaster risk by the sea, FEMA reclassifies an area.
→ City structure will adapt over time, but slowly.
- How are the losses distributed? How can policy help?
- The rich macro-housing portion of the model could be particularly useful here.

Problem 4: Congestion pricing

- Effects will be different in the short-run vs. the long-run.
 - Because of migration and job changes.

Problem 4: Congestion pricing

- Effects will be different in the short-run vs. the long-run.
 - Because of migration and job changes.
- Losses are likely larger in the short run.
 - Potential for backlash/political frictions.
 - Is there a policy path that can limit these losses?

Problem 4: Congestion pricing

- Effects will be different in the short-run vs. the long-run.
 - Because of migration and job changes.
- Losses are likely larger in the short run.
 - Potential for backlash/political frictions.
 - Is there a policy path that can limit these losses?
- Extension: Car ownership.
